Accessibility and Email Design Findings

The Nocking Point email homework | September 2026

> **Implementation summary:** The email uses one centered, single-column table inside a full-width outer table. The inner table is fixed at the recommended 600px desktop width and contracts to 100% on small screens.

Button approaches explored

Inline text link

Pros: simplest markup, works in nearly every email client, and degrades cleanly.

Cons: small click target, lower visual prominence, and less obvious as the primary action.

Styled anchor button (chosen)

Pros: familiar action shape, centered alignment, high contrast, and generous 15px by 30px padding for easier tapping.

Cons: some older clients can remove CSS styling, so the link still needs meaningful text and a useful destination.

Accessibility checks

- The document has `lang="en"`, a descriptive page title, and a viewport meta tag.
- The browser accessibility tree exposes one level-one heading, followed by level-two and level-three headings in order.
- The hero image has descriptive alternative text: “Archer aiming a blue recurve bow.”
- The primary action is exposed as a named button, “Improve Your Shot,” with a 48px rendered height.
- The unsubscribe control is a real link with underlined text, rather than text that only looks clickable.
- GitHub’s homepage was also inspected with the same browser accessibility tools. It exposed named navigation, headings, links, buttons, and footnote relationships.

Responsive and email findings

- At 1280px viewport width, the inner email table measured 600px and remained centered.
- At 390px viewport width, the inner table measured 355.2px and the hero image measured 355.2px, preventing horizontal overflow.
- The hero image uses `width: 100%` with a 600px maximum and automatic height.
- The practice tip adds a background image behind readable text with a dark overlay for contrast.
- The supplied course-example URL returned a 404 during testing, so it was not used as an accessibility comparison.
